for DNA molecule 1 1s in mammals, wirding all All-Dinding cassette and corresponding DN preventing, diagnosing and treating Chlamydia infections particular humans -

Claim 2; Fig 1; 88pp; English.

The present invention relates to novel Chlamydia pneumoniae ATP-binding cassette protein and its corresponding gene. Sequences of the invention cassette protein and its corresponding gene. Sequences of the invention of a mammal with the components. They are also used as vaccines. Application of a mammal with the components. They are also used as vaccines. Application cassette antibodies and vaccines of the invention are useful for preventing or treating Chlamydia Infection eq. infection caused by c. trachomatis, c. psittaci, c. pneumoniae or c. peccrum in mammals, as humans. The nucleic acid molecules are useful for producing as poxviruses, which are further useful for preventing and/or treating as poxviruses, which are further useful for preventing and/or treating strains that can over-express the nucleic acid molecules or express it in a non-toxic, mutated form. The present sequence is a gene encoding chamydia pneumoniae ATP-binding cassette.

```
The present sequence represents the complete genome of Chlamydia pneumoniae, and encodes proteins AAY3584-Y35879. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypebtides encoded by the open reading frames of the C. pneumoniae genome (see NAY3584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                   Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; ss.
Nucleotide sequence of the complete genome of Chlamydia pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genome sequence of Chlamydia pneumoniae

polypeptides AAY36754-Y37949. The polypeptides can be used as vaccines against chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion

The present invention relates to the isolation of Chlamydophila pneumoniae strain CML029 genes and their encoded proteins. The genes of the invention encode an ATP binding cassette gene, a secretary locus open reading frame (ORF), an endopeptidase, a protease, and transaptroclase, clp protease, a CLP protease submit, a ransalyocolase/transpeptidase, a CLP protease, or thioredoxin. The genes of the invention can be used in a vector as a vaccine for the prevention and treatment of Chlamydia infections. Also described are be and T-cell epitopes from the proteins of the invention which can be used as Chlamydia antigens. AASI8750-AASI8759 represent the C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Secretary locus ORF; protease; metalloprotease; CLP protease ATPase; CLP protease subunit; transglycolase/transpeptidase; CLPC protease; thioredoxin; Chlamydia infection; antibacterial; ds.

The present invention relates to the isolation of Chlamydophila pneumoniae strain CWL029 genes and their encoded proteins. The genes of the invention encode an ATP binding cassette gene, a secretary locus open reading frame (ORF), an endopeptidase, a protease, an endopeptidase, a cup protease submit, a metalloprotease, CLP protease ATPase, a CLP protease submit, a genes of the invention can be used in a vector as a vaccine for the prevention and treatment of Chlamydia infections. Also described are B- and T-cell epitopes from the proteins of the invention which can be used as Chlamydia antigens. AAS18750-AAS18759 represent the C. pneumoniae
                                                                                                                                                                                                                                                                                    endopeptidase;
                                                                                                                                                                                                                                                                                               Secretary locus ORF; protease; metalloprotease; CLP protease AlPase; CLP protease subunit; transglycolase/transpeptidase; CLPc protease; thioredoxin; Chlamydia infection; antibacterial; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccine useful for immunising mammals against chlamydia infections, comprises vectors having sequences of ATP binding cassette gene, secretary locus open reading frame gene of chlamydia

This sequence encodes a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can albe used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                     Antigenic protein; vaccine; Lyme disease; infection; detection; ss.

New isolated Enterococcus faecalis polynucleotides - used to develop lucts for the detection of Enterococcus and for use in vaccines prevention or attenuation of Enterococcus infection Kunsch CA; Hromockyj A, WPI; 1999-070095/06. Choi GH, P-PSDB; AAY00061 Bailey C, products

(HUMA-) HUMAN GENOME SCI INC.

The present sequence encodes an antigenic polypeptide fragment isolated from Enterooccus faecalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterooccus genus in an animal. They can also be used for detecting Enterooccus antibodies in a sample. The nuclectide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis Claim 1; Page 107-108; 301pp; English. protein activity

```

A computer readable medium has been developed which has recorded on it

982 nucleotide sequences isolated from the Enterococus faecalis genome.

AAX1993B to AAX1991 represent these nucleotide sequences which are
primary nucleotide sequences, also known as contigs. The computer-based
system can identify fragments of the Enterococus faecalis genome with

commercial importance. The products can be used to detect the presence
of Enterococus faecalis in samples. They can also be used for
diagnosing Enterococal infection in an animal and monitoring
progression of disease, and for identifying agents which can be used to
modulate the growth or pathogenicity of Enterococcus faecalis, or
another related organism, in vivo or in vitro. In particular the
polypeptides encoded by the Enterococcus faecalis nucleotide sequences

can be used in vaccines to prevent or attenuate an Enterococcal Length 1121; Sequence 1121 BP; 375 A; 186 C; 263 G; 296 T; 1 other; 20; Score 63.8; DB 20 Pred. No. 1.1e-07; 0; Mismatches 147 3.5%; Query Match

The present invention describes genes, proteins and antigenic Polypetides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis protein
                                                                                                                                                                                                                                                                                                                                                           Enterococcus faecalis; infection; vaccine; immune response; diagnosis;

Production of proteins, such as hormones, enzymes, growth factors or cytokines, in gram-positive microorganisms containing a mutation in at least one of the genes of the opp operon gene cluster

Disclosure; Fig 1A-M; 32pp; English.

The opp operon of Bacillus (also known as spook operon) encodes an oligopeptide permease that is required for the initiation of sporulation and the development of genetic competence. The opp operon is a member of the family of ATP-binding cassette (ABC) transporters involved in the import or export of oligopeptides from 3-5 amino acids. Bacillus strains containing a mutation in the opp operon produce more recombinant protein than the Wild-type strain. Therefore, gram-positive microorganing, especially Bacillus strains, containing a mutation in at least one of the genes of the opp operon can be used for heterologous protein production, especially homenes, engymes (preferably proteases such as subtilisin), growth factors or cytokines.

                                                                                                                                                                                                                                                                                                    The present sequence encodes an antigenic polypeptide fragment sociated from Enterococus faccalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faccalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal.

The present invention describes genes, proteins and antigenic polypeptides isolated from E. facealis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in a namimal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleotide products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis protein
                                                                                                                         Enterococcus faecalis; infection; vaccine; immune response; diagnosis; detection; attenuation; antigenic; ss.

AAX13938 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences. Solated from the Enterococcus faccalis genome. AAX13938 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences. Also known as contigs. The computer-based system can identify fragments of the Enterococcus faccalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faccalis in samples. They can also be used for adiagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faccalis, or polypeptides encoded by the Enterococcus faccalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                     A computer readable medium has been developed which has recorded on it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3376 aaagatgcaaaatggagtaacggcgagccaatcacagcaaatgattttgaatactcttgg 3435

16-MAY-1997;

Claim 1; Page 562-570; 2084pp; English.

A computer readable medium has been developed which has recorded on it and solution to the sequences isolated from the Enterococcus faccalis genome. AAX1938 to AAX19319 represent these nuclectide sequences which are primary nuclectide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faccalis genome with commercial importance. The products can be used to detect the presence diagnosing Enterococcus faccalis in samples. They can also be used for diagnosing Enterococcus faccalis in samples. They can also be used for modulate the growth or pathogenicity of Enterococcus faccalis, or modulate the growth or pathogenicity of Enterococcus faccalis, or another related organism, in vivo or in vitro. In particular the properties encoded by the Enterococcus faccalis nuclectide sequences can be used in vaccines to prevent or attenuate an Enterococcal

Sequence 15747 BP; 4949 A; 3274 C; 2618 G; 4899 T; 7 other;
